THE IDEAL FARMER.

"The Man With a Hoe" Does Not Belong Here.

USES UP-TO-DATE METHODS.

The American Tiller of the Soil is Different—He is Not a Clod Crusher—He Pulverizes.

We have all read of "The Man with the Hoe," he doesn't belong here—his home is on the other side of the big pond. We know how to wield the hoe all right—but we seldom do it, because we know a better, more rapid and economical system of cultivation. We hoe chiefly in the corners, and in the small truck patches.

The American farmer is different; he is the man who reads; who leans on the printing press more often than he does on the hoe. He studies books, and reads agricultural papers, and farms up-to-date. He buys tested seeds, raises pure-bred stock, is kind to his wife, and sends his children to school. He deals justly with his neighbor, and stands out for equity for all.

The American farmer is not a clod breaker—he pulverizes with a roller, and he considers the comfort of his team.

This is the ideal American farmer—the farmer that is different from the farmers of the other parts of the earth. This man is enlisted heart and soul in the cause of equity for all, and the fixing of prices of farm products by those who grew them. He stands solid for co-operation, and is one of the first to go out of the inner circle, and help in organizing a new local union.

This is the farmer that you can't down—he is shrewd enough to get within the folds of co-operation, and public spirited enough to reach out a helping hand to the fellow on the outside, to assist him up and in also.

This farmer is not alone; his kind is multiplying every day, and ahead of him and his fellows the glorious dawn of equity is breaking—the light is growing stronger; and out there at the front there is a genial glow of the sun of prosperity; glorious results wrought by the activity and unselfish devotion to a good cause, by the farmer that is different.

Indeed, the farmers of this class—the American farmer that is different from the farmers of all other countries, is an honor to the nation—a blessing in time of peace—a source of strength in time of war.

GREENWOOD HILL.

Benj. Conley of Andover visited his old home on the hill Friday and Saturday.

Miss Nora McAndrew of South Hill is visiting her many friends in this vicinity.

Herman Hoyt of Hornellsville was calling in this vicinity one day last week.

George Hurst made a business trip to Greenwood Thursday.

Mrs. George Hurst and Miss Nora McAndrew called on James Dunigan and family one day last week.

Mr. and Mrs. Alley Mead and family visited Mr. and Mrs. Earl Appear Sunday.

Mr. and Mrs. G. E. Mead of Wellsville visited their grandparents, Mr. and Mrs. Enos Mead, Sunday.

Mr. and Mrs. Benj. Conley of Andover visited Mr. and Mrs. Earl Appear Sunday.

The Telephone Stamp.

The "telephone stamp" is the latest project of the postal department, whereby a letter bearing it, will be opened by the postmaster and its contents delivered over the telephone to the person to whom it is addressed.

Always the Best.

Another new assignment of the very latest type faces just laid in our job rooms. If you want printing of any kind, from a calling card to a book, just drop us a hint and we will do the rest in the most workman-like manner and at prices that baffle all competitors. tf

It Costs Less.

If you wish to keep your friends living away posted as to things doing in Andover, just remember the NEWS, sent every week, will be cheaper than a letter every week, and will give them more information tf

AT THE SANITATIUM.

Mrs. Chas. Sharp of Hornellsville visited her sister, Miss DeGraw, and other friends, one day last week.

Dr. Deming of Friendship was a professional caller last week.

Mrs S. J. Rathbone and Miss Laura Morgan of Wellsville spent Saturday with friends.

THE ANDOVER NEWS.

VOL. XVII., NO. 32. ANDOVER, ALLEGANY COUNTY, N. Y., FRIDAY, AUGUST 14, 1903. TERMS: One Dollar a Year, 3 Cents a Single Copy.

The Silk Industry

How it Originated and the Manner of its Culture and Manufacture.

As the looms in the silk mill are about to start, an idea of the origin, culture and manufacture of these goods will be of unusual interest to Andover people. The NEWS has made a thoro investigation of the subject and submit the following facts gleaned from thoroly reliable sources.

Silk is a fabric substance, produced by many insects, principally in the form of a cocoon or covering with which the creatures are inclosed, and protected during the period of their principal transformation. The webs and nets of spiders are also of silk. But the fibers used for manufacturing purposes are exclusively produced by the mulberry silkworm of China, and a few other moths closely allied to them. Among the Chinese the name of the silkworm is "si."

The silk industry originated in China, and according to native records it has existed there from a very remote period. The Empress Se-ling-See, wife of a noted emperor, Hwangti (2640 B. C.), encouraged the culture of the mulberry tree, the rearing of the worms and the reeling of the silk. She is said to have devoted her personal attention to the rearing of the silk worms, and by the Chinese people is accredited with the invention of the loom. Ancient literature testifies not only to this but also the importance of Chinese sericulture, and to the care and attention bestowed upon it by the royal and noble families. The Chinese guarded this valuable secret with jealous care, and thousands of years passed before the outside world knew anything about its culture and manufacture. Thru Corea the knowledge of the silkworm and its product reached Japan, but not until the third century.

The silkworms are natives of southern and eastern Asia, inhabiting India, Siam and China. It was introduced into Europe from the East by the conquest of Alexander the Great, worn by the Romans and made largely by the Sicilians and Venetians. This was in the 12th century. It was the 16th century before it became in use in England.

Silk culture in America started as far back as 1622, silkworm eggs, mulberry trees and printed instructions being sent by James I. to Virginia. In 1735 eight pounds of silk were exported from Georgia, seven hundred pounds in 1758, and over ten thousand in 1759, Connecticut, Pennsylvania, New Jersey, New York, Rhode Island and Massachusetts all becoming interested in the industry, but the war of the Revolution entirely stopped it all until 1826 when further efforts were made to make of it a profitable American product, but because of the high wages of our laborers and the severity of our winter season, which kills the mulberry trees upon which the worms live, and there having been found no substitute on which to appease the captious appetites of the valuable insects, we have had to entirely abandon their culture. First reared in China, silk cocoons are now the most extensively cultivated in China, Japan, Italy, France, Spain, and other European countries with evenly warm temperature.

The Silkworm.

The mulberry-feeding moth (Bombyx mori) is the principal source of silk. In itself it is an inconspicuous moth of an ashy white color. The body of the male is not half an inch long, the female being a little longer and stouter. Its wings are short and weak. It goes in five stages—eggs, larva, chrysalis and adult. The egg is nearly round and resembles a cabbage seed in size, in color is ashy gray or cream color. The eggs are hatched by artificial heat, at the period when the leaves are ready for the feeding of the larva. When the worm hatches it is black, and is covered with long hair. He is fed on the tenderest of the tender mulberry leaves, which they only pierce, and suck the juices from. Soon, however, he becomes large enough to chew the leaves, which he does by cutting off circular chunks from the edges of the leaf. They breathe thru small holes that look like black spots, and have no eyes. When eating, their jaws move sideways, and where many are feeding together they make a noise similar to that of rain falling on dry leaves. The rearing houses in which the worms are usually kept, must be spacious, well-lighted and well-ventilated, in which scrupulous cleanliness and sweetness of air are essential, and in which the temperature may be regulated. They are, however, more hardy than is usually supposed, and endure variations of temperature from 62 to 78° F. without injury, but higher temperature is very detrimental. The lower the temperature at which they are kept the slower is their growth and development, but their health and vigor is increased and cocoon spun proportionately larger. The worms increase in size with astonishing rapidity and no less astonishing is their growing voracity. Some species molt or cast their skin but three times, but as a usual thing these silkworms shed their hides four times—the sixth, tenth, fifteenth and twenty-third days after hatching. As these molting periods approach they lose their appetites and cease eating. The common silkworm usually produces but one generation a year, but there are species in cultivation that produce two and even three generations in a single year. The silk glands or vessels consist of two long thick walled sacs running along the sides of the body, which open by a common orifice on the under lip of the larva. As the larva approaches maturity those vessels become gorged with a clear mucus fluid, which upon being exposed to the air immediately hardens to a solid mass. Advantage is often taken from this fact to prepare from fully grown larva silkworm gut, used for fish lines and numerous other purposes where lightness and strength are essential.

The Cocoons.

When the caterpillars are mature and ready to undergo their transformation into the pupa condition they cease eating and begin to ascend the brushwood branches provided for them, in which they set about spinning their cocoons, in which operation they eject from both glands simultaneously a line of thread about 4,000 yards in length, moving its head around in regular order continuously for three or four days or thereabouts. The worm works constantly, forcing the silken threads out by contraction of the body. This thin gauze-like net work soon envelopes the body, and in but a few hours the pupa is entirely hidden from view. The cocoon is simply one continuous thread of the finest silk wound around the body of the worm in figure eight loops. It is compact, tough and strong. Great care has to be exercised to see that two insects do not spin their cocoons near enough to touch each other, as in that case they unite and become double, rendering both worthless, as they cannot be separated for reeling. After a few weeks the shell of the chrysalis breaks and the moth ejects against the end of the cocoon a strong alkaline liquid, which moistens and dissolves the hard gummy lining. Pushing aside some of the silken threads and breaking others, with crumpled wings and weak body the moth comes forth. This escape of the moth from the cocoon, however, damages and breaks so many threads that they are spoiled for reeling. Therefore, when but a few days old all these not intended for seed are placed in a steam heater and suffocated, when the silk is ready to reel. The cocoon which once gave the Lebanon silk its great superiority no longer exists, and has been replaced by those introduced from Japan, which are larger in size and inferior in quality.

Filature or Reeling.

All cocoons stained by the premature death of chrysalides, pierced cocoons, double cocoons and any from other causes rendered unfit to spool are laid aside. The uninjured are assorted into classes having similar shades of color, size and quality of fiber This assorting is of great consequence, and requires the most scrutinizing attention. The object of reeling is to bring together the filaments from two or more cocoons, and to form them into one continuous uniform and regular strand, which constitutes the "raw silk" of commerce. To do this the natural gums of the cocoons which holds the filament together must be softened, the ends of the filaments of the required number of cocoons—usually four or five, and sometimes as many as twenty—are caught, and means taken to unwind and lay these filaments together so as to form a single, uniform strand of new silk. This is done by gathering the threads together and pressing them thru an eyelet a few inches above the surface of the water, passes them upward over the traverse guide-eye to the reel. This reverse moves to and fro horizontally distributing the thread in a broad band over the surface of the reel. When one of the threads break or the end of a cocoon is reached, the reeler takes a fresh one and with thumb and forefinger dexterously twists its ends around the running thread, of which it immediately becomes a constituent part. This raw silk is the material that is usually shipped to this country, and our silk mills work up into cloth, spool thread, and the various other silk apparels made by them. This is the material also that the Andover looms will start to manufacture into dress goods within a very few weeks.

Next week we will give especial attention to the method of making dress goods from raw silk as it will be done by the Andover looms.

GREAT MID-SUMMER SALE AT CANNON BROTHERS!

THERE is not much fun nor a great deal of money in selling new and staple merchandise at less than cost but there are times when the conditionsdemand it. "It is a condition not a theory that confronts us." Owing to a comparatively cold summer we have more summer goods than we can expect to dispose of this season in ordinary selling. It is contrary to our policy to allow one Season's goods to stay here longer than that season. It costs us considerable profit to constantly live up to this rule but a store cannot be kept up-to-date in any other way. For this reason we open

A Great Mid-Summer Sale Beginning Thursday, August 13th, and continuing until Saturday night August 22nd.

NINE BARGAIN DAYS.

SHOES.

25 Pairs Women's Shoes, odd sizes, etc., originaly marked at $2.00 and $3.00, sale price 98c
