

July 14, 1916
127 YEARS AGO TO-DAY
The French Revolution Began

Altho few realize the fact, the spark of liberty was carried from America by the Marquis de Lafayette, our great benefactor. In National Convocation in Paris he proposed the "Declaration of Rights" which was one cause of the French Revolution. Thus the idea of freedom was passed onward.

Personal liberty in this day and age can be assured in no better way than by possessing a snug account in this bank.

BUICK \$665 FOUR SLIPS QUIETLY IN

Its Appearance Identifies it Immediately. Embodies Buick Valve-in-Head Motor Roadster Body on Same Chassis Costs \$650

So quickly that it almost came upon the market unheralded, the latest product of the Buick Motor Co., Flint, Mich., has taken its place on the road, for already nearly a thousand of the little-fuss quietness is by no means unintentional. The car which is built after the fashion of its larger brothers in so many respects is to be allowed to stand wholly on its merits and sell itself, so to speak. No great fuss will be made over it; there will be no coddling or petting, and the pup will have to show its breeding with but little assistance from the publicity department. This does not mean, however, that anyone in the Buick army has any doubt as to what impression the car will make upon the buying public. Quite the contrary. They are mortally afraid that if too much fuss is made there will be no pacifying those who want cars and cannot even get promises. And the bare floors of Buick salesrooms bear witness to the soundness of the reasoning involved.

From stem to stern, outside and in, the new car is a Buick. It has the characteristic Buick body lines and, under the black hood, the Buick Valve-in-head motor with four block-cast cylinders 3 1/4, gearset built as a unit with the motor and the whole three-point suspended. It has Delco ignition-lighting-starting system, and 31x4 tires. The motor is credited with developing 35 horse-power on the brake. The same chassis carries two bodies—five-passenger touring at \$665—model "D35"—and two-passenger roadster at \$650—model "D34." The wheelbase is 106 inches.

Like its bigger brothers, the Buick four is finished all over in black and white striping on the wheels; the black upholstery is in genuine leather, deeply tufted. Springs are all semi-elliptics and nearly flat, 30 inches long in front and 48 inches in the rear. Moderate weight is a feature that has a great deal to recommend it from the points of view of maintenance; the roadster weighs 1,935 and the touring car 2,052 pounds.

A glance over the mechanical details will reveal matters that are familiar to Buick users. The cylinder head is detachable and the valves are actuated by noiseless ball-end push-rods, adjustable for wear. Three babbitt-lined bearings support the crankshaft, and lubrication is effected by the usual constant-level splash system, with a cam-driven circulation pump and a separate oil feed to the timing gears. Fuel is fed to the carburetor by a vacuum system from the tank at the rear end of the frame. Water is pumped circulated.

Included in the transmission system are a leather-faced cone-clutch, three-speed gearset on ball and roller bearings and bronze bushings, enclosed propeller shaft with a single large universal joint to the rear end of the gearbox, and three-quarter floating rear axle with the drive shafts running on roller bearings and ball thrust bearings for the bevels and the differential. Torque stresses are taken by the propeller shaft tube and universal and drive by the rear springs. Steering is by a semi-irreversible gear with worm and split nut and a ball thrust bearing, adjustable for wear; the hand wheel is 16 inches in diameter and finished in black enamel and carries the spark and throttle levers, which operate in friction retainers.

Standard equipment includes all the usual items, including double-bulb headlights, instrument board, ramp, electric horn, speedometer, extra demountable rim with tire carrier and one-man top.

It wouldn't pay a merchant to advertise goods unless it would pay the ad-reader to buy them.

XXX. NO. 29. TITLE PARALYSIS IS IN ANDOVER O'Donnell Ill With the Disease. Medical Here. Information O'Donnell, the son of Dr. and Mrs. O'Donnell, has been afflicted by the dreadful infantile paralysis. He is not seriously ill and all the physicians have been called into consultation, including the District Commissioner, Dr. J. J. O'Donnell, of Jamestown, N. Y., Mrs. John J. and Kelly, of Hornell, G. family hopeful assurance the little one will be to good health. However, be on the watch their children. That they may know symptoms and care necessary herewith information by the State Health Department, written by Herman M. D., State Health Commissioner.

General Statement
Infantile paralysis is a disease of the cord or its extension in the brain. It is manifested sometimes convulsions, vomiting, diarrhoea, and followed by paresis or paralysis of one or groups of muscles, usually arms and legs. There are times symptoms resemble meningitis, including rigidity of the neck. There may be difficulty in swallowing. Stiffness along the spine affected muscles are frequently present. The onset may be sudden or gradual. Infants and young children are most affected; older children less frequently so. The disease is caused by the smallest organisms known and is not detected with any microscope. How these organisms are gotten into the mass may be seen. The disease is contracted from a susceptible to it, receive the nose and throat infection from the nose, the bowels of persons ill with disease, convalescent from who are healthy "carriers" these germs by direct contact through the intermediary of household utensils, handkerchiefs, towels and possibly by pets and flies. When the organism has had access to the nose and it grows rapidly and reaches the brain or spinal cord through small passages in the part of the nasal cavity walls of the blood vessels supplying the nerve cells. Their calibre consists of the blood supply of the partially or wholly cut off in the degenerative nerve cells and the ending nerves, together with paralysis of the muscles which the nerves are distributed. The infective agent is resistant to carbolic acid, therefore of little or no infection.

Precaution to Parents and Others
1.—When the symptoms described appear in a person of your household summon a physician immediately. Keep members of the family away from the affected person.
2.—Protect your family and the patient to a hospital. The family physician should be consulted. If hospital accommodations are not available the patient must be isolated at a place where your physician and the nurse will direct.
3.—If the child is at school you should notify the principal of the school. If the child has recently been to school notify the Sunday School teacher.
