Take the case of the farmers who Sampson was the lowest bidder. produced. Only an accident will enable him to make profits in most But if those same farmers will keep an individual feed and milk record on each cow, and sell off the poor producers and feed the remainder correctly, profits are certain to follow. Time after time, it has been proven that cows which eat the most in dollars' worth of feed produce the most milk, the most butterfat, the greatest gross income and, most important of all, the

greatest average income over cost A little study will show why this s true. A cow needs food for two purposes, to keep alive and to produce milk. Under normal conditions about half of the food is used for the maintenance of the body and) the other half goes into the milk. But that does not mean that if you amount the cow ought to give, she will give more milk. In other words, there is a well-defined limit. A cow that is fed too much will produce the same amount of milk that she would if she was fed just enough. The excess food will be utilized in adding weight. That extra weight is of no value unless the cow happens to be underweight,

unless she happens to be preparing for a period when it will be necessary to draw ucon a reserve. Overfeeding, therefore, leads to reduced) Underfeeding also leads to re-

duced profits but from another cause. Self-preservation comes first always. That 50-50 division of food between what is needed to maintain the body and the amount that goes into the production of milk will not hold good when the cow is fed too little, for the simple reason that the body needs come first. When they are vatisfied, then production starts. Take a cow weighing 1,000 pounds, that produces three gallons of four per cent. butterfat milk when fea normally. She will produce that same amount of milk if overfed but possibly only half that amount for body maintenance remains. same in all three cases. study of thousands upon thou-

sands of individual records shows that a cow which produces twice the milk of another cow will eat about 50 per cent, more than the secon cow. A 100 per cent. increase in investment is a pretty good margin. There are a number of general rules for feeding dairy cows. An old one is to feed Holsteins one pounds (pints) of milk produced. Jerseys are supposed to require on bound of grain to every four poun of milk, with Guernseys in between. Cows are just as individual their eating as humans. You have to study each cow and feed accord ing to her production. You mus. also study the combinations of food Silage, legume hays and grains when fed to the derry cow in the righ proportions will produce milk at a profit. For every dollar spent
