> Destructive vibrations removed these gases into the upper atmosphere and with them the normal supply of moisture. This produced destructive droughts at witnessed by the drought period from 1930 to 1934. This drought period might have gone on until all

life was destroyed, not by the usual diseases, but by

famine, extreme electro-dynamics and extreme thermoprostration, scalds and burns, traumatism, sickness dynamics. The drought period abated somewhat 1935 and 1936, due to the millions of tons of drought lwith the fog gases and moisture which had been asnirlated into the upper atmosphere by destructive vibraions. These artificial destructive vibration clouds saturated with water vapors drifted about at low altitudes land when over low-pressure areas deposited their moisture in torrential rains. These torrential rains pro-(duced a vacuum above, pulling neighboring malignant

clouds to the flooded area. An illustration of the effect of destructive vibrations was the post war epidemic of influenza. The war ceased suddenly and thousands of airplanes left the air. There was a complete cessation of gun fire and heavy explosions. This sudden change produced world over atmospheric stasis, and permitted the rapid formation and accumulation of blood disintegrating gas groups. These gases disintegrated both stable and unof poor respirability which occur seasonally, periodical-stable blood, resulting in the worst epidemic of in-

ly and chiefly nocturnally, all over the world. Typical fluenza ever known; an epidemic that took a million Another example was the death-laden Belgian fog was saturated with blood disintegrating atmospheric gases which rapidly precipitated an epidemic of asthma, coryza, pneumonia, influenza and general malaise.

took the lives of about 80 people in six days. At first it was believed that the heavy rain had washed out tanks of poison gas that had been buried for war purposes, but a there investigation proved this was not the case.
