ASK THE SCIENTIST

If you have a question to ask the scientists, mail it to the New York Press Association, The Castle, Syracuse, 10, New York. The Science Board of the Radio Workshop at Syracuse University will answer each week in the Andover News those questions considered most interesting and timely.

Question 1. Have new methods been found to speed up the healing of open wounds?

ANSWER. Uninfected wounds generally heal rapidly and uneventfully, so that there is really no particular need for anything to hasten the healing.

Many different substances have, from time to time, been alleged by their sponsors to stimulate cell division, and thus hasten the healing of wounds, but their effectiveness has proven questionable and they are seldom used by surgeons at present. One such substance widely used was cod liver oil, but the usual practice now is to dust a wound with sulphamidimide or sulphathiazole, after thoroughly cleaning it—called debridement—and await the healing done by nature.—Prof. Henry Jones, bacteriologist.

Question 2. How come volcanoes are found in certain parts of the earth and not in others? What conditions must be present before a region may be called volcanic?

ANSWER. Volcanoes are only incidents in an undercover war. They are something like the red rash of scarlet fever—obvious, and indicative of distress, but far from being the whole of the affliction.

The interior of the earth is hot. At the temperature there, some kinds of rocks would be melted except for the pressure of the overlaying rocks (they take up more space as liquids and, therefore, must expand in order to melt, and the pressure keeps them from expanding and, therefore, from melting.)

In some places on the earth the pressure is relieved, usually by the same forces that make mountains. When this relief occurs, the hot rocks may become melted and form a reservoir of molten rock, or magma—lava, when it comes to the surface—in the earth.

If some of this hot liquid rock leaks through to the surface of the earth, it forms a volcano. It is sometimes said that volcanoes are found along lines of weakness in the earth crust. It is true, first, that the usual pressures within the earth must be relieved, and second, that paths of migration—or cracks in the earth's crust—must be present to let the lava reach the surface. Wherever this occurs there is a volcanic area or region.

Whether the country is cold or hot makes no difference. Regionalism has nothing to do with it. Volcanoes have been found anywhere from the Aleutians to Cape Horn.—Dr. Earl T. Apfel, geologist.

Question 3. Can scientists actually create life?

ANSWER. Scientists know what elements occur in living material, but they are unable to put these elements together in order to make living forms of matter from non-living. Life seems to be a state of matter.

We have matter in the living state and we have the same matter in the dead state. A single cell may be fully alive, then frozen and it dies; yet all the materials are still there that exist in living matter although it is dead. No, scientists definitely cannot create life.—Dr. Ernest Reed, geneticist.

Question 4. How long will our present coal supply last if used at the present rate of consumption?

ANSWER. In volume, our present supply of coal equals more than the amount of matter

used to build the Panama Canal. But the problem is more economic than how much coal is left. Not all the coal left is near enough to the earth's surface or in veins thick enough to be taken out by mining process.

There have been many recent estimates as to how long our present supply of coal will last. I estimate about 1,000 years at the present rate of consumption. A recent estimate which seems pretty pessimistic to me, is about one-third of 1,000 years. If all the coal were taken out of the ground, it would last 3,000 years.—Dr. Apfel.

Something's Missing
The guide was conducting a tourist party through the automobile plant. He stopped by the assembly line. "Do you know what would happen if that man over there ever missed a day at work?" he asked the members of the party.
"No, what would happen?" spoke up one.
"Twenty-two hundred and sixty-one cars would go out of the factory without springs."

"Say, mister," said an interested onlooker, "that fellow's been off a lot, hasn't he?"

A smart secretary can move an inkwell or lay a pencil down in a manner to make her boss wince.

Ration Reminders

MEATS, FATS—Red Stamps Q2 through U2 expire August 31. Red Stamps V2 through Z2 expire September 30. Red Stamps

A1 through E1 expire October 31. Red Stamps F1 through K1 expire November 30.

PROCESSED FOODS—Blue Stamps Y2, Z2, A1, B1, C1 expire August 31. Blue Stamps D1 through H1 expire September 30. Blue Stamps J1 through N1 expire October 31. Blue Stamps P1 through T1 expire November 30.

SUGAR STAMPS—36 expires August 31. Next stamp becomes valid September 1.

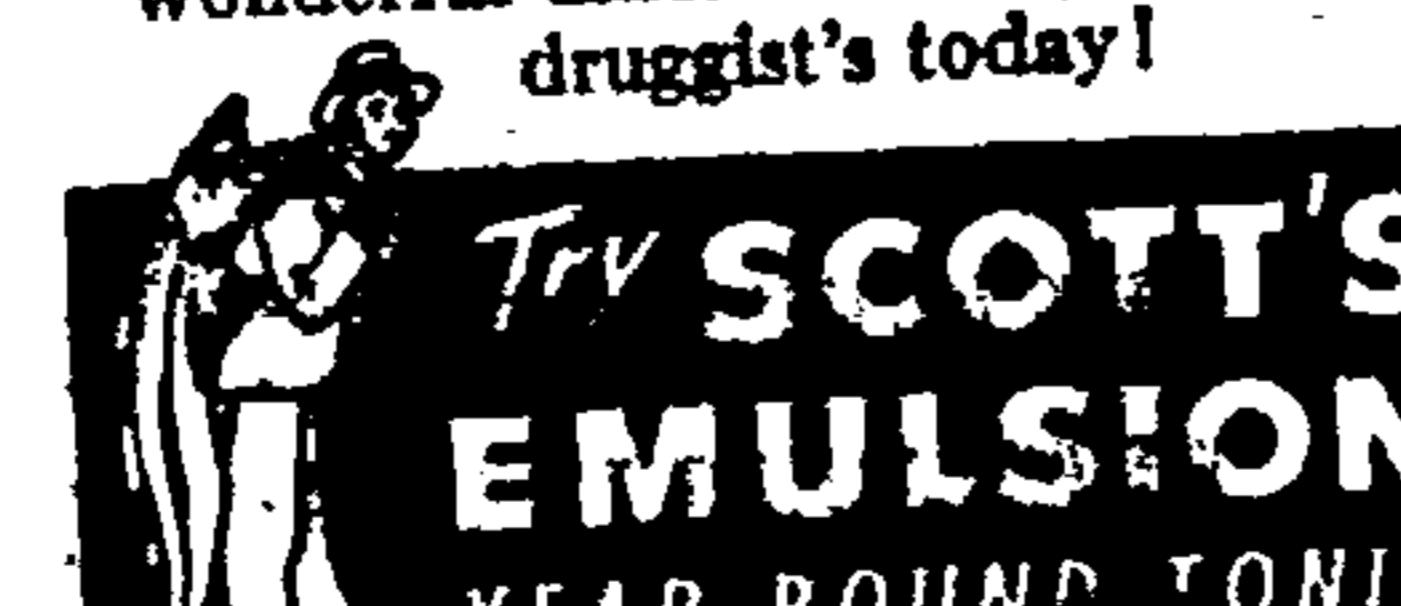

FUEL OIL—Period 1, 2, 3, 4, and 5 coupons, good for ten gallons per unit, continues valid throughout the country for the rest of the heating year. New Period 1 coupon in the 1945-46 ration may be used anytime after June 1.

SHOES—Airplane Stamps Nos. 1, 2, 3, 4, in Book Three continue valid indefinitely.

HIGH ENERGY TONIC

helps build SUMMER STAMINA! ENERGY!

Enjoy the feeling of energetic well being! Take good-tasting Scott's Emulsion right away if you feel tired, rundown, unable to throw off those worrisome summer colds—because your diet lacks natural A & D Vitamins and energy-building, natural oils. Scott's helps build energy, stamina, resistance—try it! Soon you may feel a wonderful difference. Buy at your druggist's today!

DOCTORS HAVE NEW DISCOVERY TREATMENT FOR BURNS, SCALDS
Believe burn pain almost instantly. NEW SCOTT'S EMULSION with cod liver oil containing natural A and D Vitamins ends burn misery... promotes rapid healing. Soothes minor cuts and skin irritations. Handy tube!

Andover's Roll of Honor
